

Combined Forefoot and Rearfoot & Ankle Cadaver Surgical Skills Courses

The Technical Training Courses have an emphasis on cadaver surgery. During the first day surgical cases are observed and an in-depth hands-on internal fixation lab is taught using bone models. Procedures range from 5th digit arthroplasties to complex rearfoot fusions. Each participant receives one limb and the use of power equipment and internal fixation. The instruction during the labs is available on both a group and individual level. Additional time is provided to allow for exploratory dissection, or additional practice of previous procedures. Throughout the course, surgical topics are discussed and participants are encouraged to bring individual cases to discuss with the faculty. All courses are Thursday through Saturday. There is a limit of 16 attendees for each course, so please call ahead to check availability.

Scientific Objectives

- To increase the attendees comfort with performing common podiatric forefoot and basic rearfoot surgical procedures through live surgical observation and hands on participation with cadaver limbs.
- Identify weaknesses in attendees surgical technique and improve those skills through hands on participation with cadaver limbs and other manual skills labs.
- Learn multiple, alternative options for fixation of osteotomies and/or fractures
- Expose the surgeon to new surgical techniques and latest trends to increase the attendees armamentarium of surgical procedures and techniques
- Establish understanding of pre-op indications and criteria for surgical procedures to improve selection of the appropriate procedure
- Decrease potential of post-op complications by increasing attendees understanding of proper surgical technique and choice of fixation
- Refresh knowledge on hospital protocol for inpatient and ER patients through participation in hospital rounds
- Improve practice management skills by group discussions
